# The AMP NETCONNECT Warranties

## 25 Years Warranty

### Twenty-five years from now, you'll thank us.

We are confident that your AMP NETCONNECT system will keep performing to current industry standards. If ever it does not meet those standards within 25 years of the date of installation, we'll provide the reasonable parts and labor to replace or repair the AMP NETCONNECT product.

- 25 years coverage on system performance
- 25 years coverage on components
- 25 years coverage on applications
- Based on industry standards
- Includes parts and labor
- Tyco Electronics provides coverage directly to the end user— if something is wrong, Tyco Electronics will make it right

### It's Standard Equipment

This coverage is automatically part of the package when you specify AMP NETCONNECT products end-to-end and when a Tyco Electronics-authorized NETCONNECT Design & Installation (ND&I) contractor registers the network design with Tyco Electronics and performs the actual installation in accordance with AMP NETCONNECT requirements.

### Who's Covered

Unlike most system suppliers, Tyco Electronics provides warranty coverage directly to the end user.

Many suppliers provide coverage to the installers, who then provide coverage to the customers. But with the Tyco Electronics warranties, there are no middlemen. The warranties are between you and Tyco Electronics.

Which means if something goes wrong, we'll fix it.

Some conditions may apply. For more information contact your local AMP NETCONNECT sales office (see backpage of this catalog for Phone and Fax).

# How to select a Cabling System

## Turning the Right Components Into a Complete Network Infrastructure System

AMP NETCONNECT is one of the leading companies in premise cabling systems and offers a big spectrum of products for networking installations. The intention of this catalog is to provide a good overview over the available components in different technologies. Therefore the catalog is splitted into Unshielded Twisted Pair (Chapter 1), Shielded Twisted Pair (Chapter 2) and Fibre Optic (Chapter 3) Cabling Systems. Within these chapters the components are grouped by family (system cables, patch panels, connectivity, outlets, patch cords etc.). Unpopulated universal outlets and faceplates applicable for all 3 technologies can be found in Chapter 5. Active devices like Ethernet Switches, Media Converters or Wireless LAN equipment are located in Chapter 4. Tools, baluns, cable management and labeling accessories in Chapter 6 are completing the product portfolio.

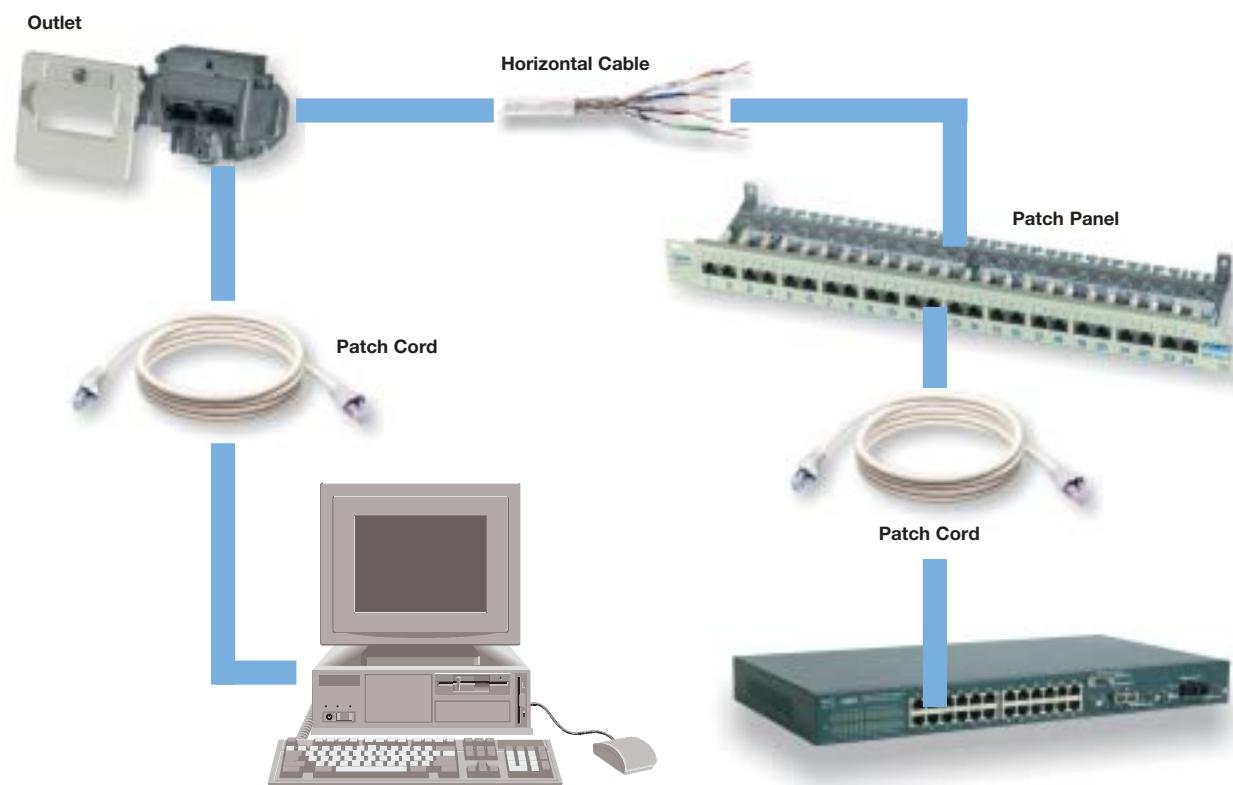

To provide a quick guide for selecting the correct system components in an easy way, the following 3 pages offer a "system selection guideline":

- **Step 1:** Which technology is selected?  
Unshielded Twisted Pair (UTP), Shielded Twisted Pair (STP) or Fibre Optic (FO)
- **Step 2:** Which System Performance is needed?  
Category 3, 5E, 6 or 7 for Twisted Pair – OM1, 2, 3 (multimode) or OS1 (singlemode) for Fibre Optic
- **Step 3:** What kind of connector termination should be used?  
Classic IDC Block Jack, variable edge connector system or CrossConnect for Twisted Pair (TP) – Epoxy/splicing technologies, quick termination technology or a ready-terminated system for Fibre Optic

After these main questions are answered only those Connectivity Systems remain that meet the selected criteria. The planner can use the block arrow schemes on pages 4, 5 and 6 which refer to a channel link (see figure below). Following these block arrows from left to right will help finding the required system components quickly. Within one arrow all components are exchangeable and can be combined with other products of the following arrows.

**Example:** A shielded, Category 6 IDC Block Jack System should be created (→ STP → Cat. 6 → IDC Block Jack).

Remaining options are the **SL 110Connect System** with cable jacks (page 41) as well as the **AMP-TWIST-6S System** using either die-cast dual outlets (page 45) or also cable jacks (page 41). The patch panel choice for both systems is either the PCB-based 24-port-panel (page 31) or unpopulated patch panels (page 32) that can be filled with cable jacks. For system horizontal cable PiMF COMPACT 250 (page 28) is the minimum choice. Patch cords for this system are found on page 46, accessories in the related chapters mentioned at the bottom of each of the following 3 pages.

### PoE Midspan Units

Power over Ethernet (PoE) according to IEEE 802.3af defines the simultaneous provision of low voltage and Ethernet data signals over a cabling system compliant to the ISO 11801:2002 standard. Now, remote devices like VoIP phones, W-LAN Access Points, security devices and much more can be powered remotely.

The AMP NETCONNECT PoE Midspan devices allow the insertion of power into as many as 8 (8 port version) or 24 outlets (24 port version) while providing Ethernet, Fast Ethernet and Gigabit Ethernet data. Up to three devices of the 8 Port version or one device of the 24 port version can be mounted into a 19", 1 U rack space.

## XG 10 Gb/s Approved

### High Speed 10 Gigabit Ethernet over Twisted Pair and Fiber Optic Cabling

The XG 10 GB/S APPROVED logo marks all products of the XG family. No matter whether copper or fibre – AMP NETCONNECT offers a complete end-to-end system for all cabling media.

The new XG Copper System complies already today to the upcoming 10 Gb/s standard IEEE 802.3an, which is expected to be released in summer 2006. The system's outstanding AlienNEXT suppression was tested and certified by the independant DELTA labs in Denmark. This guarantees 10GBase-T performance over 100 m link length.

The acknowledged XG Fibre System has proven its performance and reliability in the market for several years. The system was now extended by a LC connector for quick termination.

## Pyramid Tested

### The Conformity and Quality Trademark for Real Cat. 6 Component Performance

All products in this catalog that feature the PYRAMID TESTED logo totally comply with the de-embedded testing requirements of the standards TIA / EIA 568 B.2-1 (UTP & STP), IEC 60603-7-4 (UTP) and IEC 60603-7-5 (STP). Accordingly these products fulfill the performance requirements of Cat. 6 for components which guarantees interoperability and backward-compatibility between products.

During development and production these products are tested with a worldwide standardized test setup, heart piece of which is a pyramidal test head. This exactly defined shape guarantees repeatability of the results. Most significant advantage for end-users is a wide range of system- and vendor-independent patch cords suitable to reach Cat. 6.

## Ensured Performance

### Optimized Physical Contact (OPC) enhances your link parameters – for high speed and high quality

Why do you require a controlled ferrule end face? Enhanced services such as Gigabit and 10 Gigabit Ethernet require a high quality cabling system. Therefore, IEC 60874-19-1 specifies the dimensional details of SC connectors in order to ensure intermatability and performance within an ISO 11801 specified application. These dimensional requirements are directly related to the endface characteristics of a polished ferrule, namely its **Radius**, **Dome Offset** and **Fibre Position**.

If these ferrule characteristics are optimal an **Optimized Physical Contact (OPC)** between the two connectors is guaranteed. This will enhance data transmission parameters like **Optical Performance, Attenuation, Return Loss** and **Data Link Stability**.

Also, the optical **intermatability** between connectors of different suppliers can be ensured by controlled endfaces. As a result of **OPC** a stable physical contact between the endfaces is achieved. This provides a very low Insertion Loss as well as a high Return Loss in order to run high speed applications like Gigabit or 10 Gigabit Ethernet.

All Products in this catalog that feature the ENSURED PERFORMANCE logo provide **OPC** at all time. AMP NETCONNECT guarantees a controlled endface for all OM3 assemblies and field installable products (MT-RJ and LightCrimp Plus).
